

INSTRUCTIONS FOR USE:

1. Place Symmetric • Aire Mattress on bed frame with foot end markings at proper end of bed.
2. Apply linens, utilizing "D" rings for flat sheet. To secure linens (a) to Symmetric • Aire Mattress (b), thread four corners through D-rings (c) attached to mattress as shown in **A**. To ensure proper therapy, do not pull linens taut. Linens should remain loose and wrinkly on surface of mattress.
3. Position patient.

CAUTION: Check patient's skin regularly. Consult physician if any redness or skin break occurs. **Serious injury could result if the patient's skin condition is left untreated.**

Symmetric Aire Theory of Operation

Refer to Symmetric Aire Pneumatic diagram (Fig. 1) for the following explanation:

The **foam filled air cells** are pneumatically separated into 3 sections including the Head, Seat and Foot. They form the therapeutic support area of the mattress.

The **air reservoir** at the foot end of the mattress contains a pneumatic **sequence valve** that regulates the head and seat air cell pressure to less than 21 mmHg.

When a patient is placed on the mattress, air is displaced out of the **foam filled air cells** through tubing and the **zone check valves** to the **sequence valve**. If the pressure to the **sequence valve** is greater than 21 mmHg, the valve will open allowing the air into the **air reservoir**. When the patient is removed from the mattress, the foam in each of the **foam filled air cells** expand and draws the air back out of the **air reservoir**. In general, the reservoir is only pressurized / filled when there is a patient on the mattress and should be depressurized / flat when the patient is removed.

The **zone check valves** separate the 3 zones of the mattress and direct the flow of air through the system in a specific route through plastic tubing. The direction of flow is from the **light** colored side of the valve toward the **dark** colored side (white to black).

The **schrader valve** has a pin with a tag attached installed during manufacturing. This pin holds the **schrader valve** open so the system cannot pressurize to allow for folding, packaging and atmospheric pressure changes during shipment to the customer. Before patient use, the pin **MUST** be removed thereby closing the system for proper operation / pressurization.

If the pin is not removed from the **Schrader valve**, the mattress will NOT be able to pressurize /support the patient properly and can cause premature failure of the **foam filled air cells**. The Schrader valve is NOT intended to inflate the mattress. The mattress automatically inflates itself through expansion of the **foam filled air cells**. **DO NOT** inflate the mattress by any other means.

The **inlet check valve** automatically allows air into the system as needed to keep the system properly inflated.

Figure 1 – Symmetric Aire Pneumatic Diagram

Care Instructions :

1. Manually clean surface with warm water and a mild detergent and a sponge or cloth removing all visible soiling or spills.
2. Thoroughly rinse with clean water for 30 seconds.
3. Air dry or wipe clean with a clean cloth.
4. Apply a disinfectant such as 10% chlorinated bleach solution (chlorinated bleach with 5.25% sodium hypochlorite).
5. Allow to air dry. Solution contact time is what makes disinfection effective.
6. Wipe off excess disinfectant with a clean dry cloth. Solutions containing alcohol ARE NOT recommended.
